# The C90 encoding for Thai 

Werner Lemberg<br>2005/07/04

## 1 Introduction

This file describes a font encoding for Thai, as presented in a TUGboat article [1]. The glyph names follow the Adobe Glyph List (AGL) [2] recommendations. Since most available Thai fonts neither use AGL glyph names nor follow the font encoding used here, you have to be careful in setting up a proper encoding vector. A specialty (for reasons explained below) is that three glyphs, namely /uni0E38 (Thai character 'sara u'), /uni0E39 (Thai character 'sara uu'), and /uniOE3A (Thai character 'phinthu') must appear twice in the encoding; the additional glyph indices are $0 \times 80,0 \times 81$, and $0 \times 82$, respectively.

## 2 Ligatures

The tricky part is implementing the ligatures. TeX's ligature mechanism only provides contextual patterns of length 2. Due to the very nature of the ETX format, ligatures aren't grouped into classes which makes this file rather long.

Thai glyphs can be grouped functionally into base glyphs (which are spacing glyphs) and diacritics (which have zero advance width). Usually, diacritical glyphs represent either vowels or tone indicators, whereas base glyphs represent consonants - I won't go into detail here; please read the Unicode standard [4] or any introduction into the Thai script for more information.

The general composing rules are as follows:

$$
C V \longrightarrow \begin{gathered}
\\
V \\
C,
\end{gathered} \quad C T \longrightarrow \begin{gathered}
T \\
C
\end{gathered} \quad C V T \longrightarrow C, \quad C v \longrightarrow \begin{gathered}
V \\
V
\end{gathered} \quad C v T \longrightarrow \begin{gathered}
T \\
C
\end{gathered}
$$

where $C$ represents a base consonant, $V$ an upper vowel, $v$ a lower vowel, and $T$ a tone mark. The tone mark always comes last.

Sometimes you will find documents which have first the tone mark and then the vowel. In real Thai input systems, this error will be catched and fixed by reordering the characters according to the TIS-620 Thai encoding standard before any output is created. The ligatures given below are not able to handle such incorrect data, and you have to normalize it before using them.

It depends on context where the diacritics are exactly positioned; some base glyphs have overlong ascenders or descenders, making it necessary to shift the diacritics vertically and horizontally.

To complicate things, the Thai vowel 'sara am' (TIS-620 code point 0xD3, Unicode value U+0E33), which looks like the final nasal sign 'nikhahit' (0xED, U+0E4D) followed by the vowel 'sara aa' ( $0 x D 2$, U+0E32), will be decomposed into these two glyphs for rendering. The difficulty is that we must position the tone mark of the previous character properly! Thus we have

$$
C+S M \longrightarrow \begin{aligned}
& N \\
& C+S A,
\end{aligned} \quad C+T+S M \longrightarrow \begin{aligned}
& \\
& \\
& \\
& C
\end{aligned}
$$

A last specialty (used for Sanskrit written in Thai) is that 'sara aa' if it follows the independent vowel letter 'ru' ( $0 \mathrm{xC} 4, \mathrm{U}+0 \mathrm{E} 24$ ) or 'lu' ( $0 \mathrm{xC6}, \mathrm{U}+0 \mathrm{E} 26$ ) is replaced with the 'lakkhangyao' sign (0xE5, U+0E45).

## 3 Glyph Classes

To describe the patterns and rules we start with defining glyph classes.
base $_{\text {normal }}$ Normal base glyphs without special features.
$\boldsymbol{b a s e}_{\boldsymbol{d e s c}}$ Base glyphs with descender.
base desclike These base glyphs consist of two elements which look like a normal base glyph combined with a lower vowel diacritic; the diacritic-like element will be omitted if combined with a lower vowel.
$\boldsymbol{b a s e}_{\boldsymbol{a s c}}$ Base glyphs with an ascender on the right side.
base $_{\text {indic }}$ The two independent vowels $r u$ and $l u$.
base $_{\text {sign }}$ The sign lakkhangyao.
base $_{\text {sara am }}$ The vowel sara am.
base $_{\text {sara aa }}$ a The vowel sara aa.
lower Lower vowel diacritics.
$u^{p p e r} \boldsymbol{r}_{\text {vowel }}$ Upper vowel diacritics.
upper $_{\text {sign }}$ The nikhahit final nasal sign.
top Tone marks.
Here the glyph variant classes:
base $_{\text {descless }}$ The glyphs of class base desclike without the lower part.
lower $_{\text {low }}$ The glyphs of class lower shifted downwards.
upper $_{\text {vowel }_{\text {left }}}$ The glyphs of class upper ${ }_{\text {vowel }}$ shifted to the left.
upper $_{\text {sign }_{l e f t}}$ The glyphs of class upper $\operatorname{sign}$ shifted to the left.
$\boldsymbol{t o p}_{\text {left }}$ The glyphs of class top shifted to the left.
$\boldsymbol{t o p}_{\text {low }}$ The glyphs of class top shifted downwards.
$\boldsymbol{t o p}_{\text {low-left }}$ The glyphs of class top shifted to the left and downwards.

## 4 Context Patterns

Using the glyph classes defined in the last section it is easy to describe the context patterns for base glyphs with diacritical signs. Surprisingly, these patterns are quite systematic. Patterns in table 1 which are marked with an asterisk do nothing and are listed for completeness only. Note that these patterns cover combinations which don't happen in the Thai script (which doesn't harm).

Table 2 covers the ligatures of the character sara am. Finally, table 3 describes the letters specific to Sanskrit.

## $5 \quad \mathrm{~T}_{\mathrm{E}}$ 's Ligature Mechanism

A small introduction into the exotic variants of $\mathrm{T}_{\mathrm{E}}$ 's ligature mechanism which probably many users haven't seen before. Additionally, the documentation in the METAFONTbook [3] is very sparse. In the following examples METAFONT's notation is used.

The usual ligature action of two glyphs $a$ and $b$ is the replacement of both glyphs with another glyph $c$.

$$
\mathrm{a} b=: \mathrm{c}
$$

Another possibility is to retain the left or the right original glyph (before and after the ligature, respectively) or both.

$$
\mathrm{a} b|=: \mathrm{c} \quad \mathrm{a} b=:|\mathrm{c} \quad \mathrm{a} b|=:| \mathrm{c}
$$

The first rule creates $a c$, the second $c b$, and the last $a c b$. In all three cases, the current point after appying the ligature rule is still at the first glyph of the replaced glyphs, and $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ simply restarts there to check ligatures (and kernings). A classical example is

$$
\mathrm{ffi} \rightarrow \mathrm{ffi} \rightarrow \mathrm{ffi}
$$

To advance the current point to the right, append either > or >> (the latter is only possible if you retain both input glyphs). Here are the remaining four ligature rules.

$$
\begin{array}{cc}
\text { a b } \mid=:>c \quad \text { a b }=: \mid>c \\
\mathrm{a} b|=:|>c & \text { a b }|=:| \gg c
\end{array}
$$

For Thai ligatures, the most often needed rule is $\mathrm{I}=$ : (i.e., retain the left glyph and stay at the same position before applying the next ligature rule). Note that using I=: > instead is not a good idea since this would prohibit kerning between the left glyph and the ligature.

## 6 Ligature Rules

As just explained, $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ can only handle context patterns of length 2, whereas Thai needs patterns of length 3 . It was an interesting challenge to find out whether the problem can be solved with $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ 's somewhat restricted ligature rules - the gentle reader is invited to find a solution by herself! There won't be any difficulties in understanding ligatures afterwards.

The tables 4,5 , and 6 use the same conventions as tables 1,2 , and 3 , respectively. The current point isn't increased in any of the rules.

Most of the ligature rules can be derived easily by handling the patterns sequentially (quite similar to logic puzzles found in various magazines), but at the end there remain two patterns which apparently contradict.

$$
\begin{aligned}
& \text { base lower top } \rightarrow \text { base lower } \text { top }_{\text {low }} \\
& \text { base }_{\text {asc }} \text { lower top } \rightarrow \text { base asc }_{\text {ase }} \text { lower top-left }
\end{aligned}
$$

After applying ligature rules for the first two glyph classes it is necessary to handle the context 'lower top', but depending on the previous glyph class top must be replaced with topleft and top low-left, respectively. With a context pattern length of 3 this would be easy to solve, but $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ doesn't have this feature. What to do?

The context 'base lower top' must be distinguished from 'base asc lower top', i.e., two different lower classes are needed depending on the previous character since $T_{E} X$ is not able to forward information from one ligature cycle to the next. The idea is now to create an 'alias class', a class which behaves identically to

| base | base $_{\text {sara }}$ am | $\rightarrow$ base | upper $_{\text {sign }}$ | base $_{\text {sara }}$ am |
| :--- | :--- | :--- | :--- | :--- |
| base $_{\text {asc }}$ | base $_{\text {sara am }}$ | $\rightarrow$ base $_{\text {asc }}$ | upper $_{\text {sign }_{\text {left }}}$ base $_{\text {sara am }}$ |  |

$$
\text { base }_{\text {indic }} \text { base }_{\text {sara }} \text { aa } \rightarrow \text { base }_{\text {indic }} \text { base }_{\text {sign }}
$$

the original one. The glyphs in this alias class are the same, but different glyph indices and glyph names are assigned to it. A closer look to table 4 shows that lower left isn't a typo but the alias class of lower. $^{\text {l }}$

## 7 The Implementation

After solving the problem theoretically now the practical implementation. All glyph names follow the Adobe Glyph List (AGL) [2]. There are no predefined Adobe glyph names for Thai, so the prefix 'uni' with attached Unicode value will be used for all glyphs which are encoded in Unicode. Glyph variants are identified by an arbitrarily chosen postfix.

Here the real glyph names for the various classes. Hexadecimal values in parentheses after the glyph name give the glyph indices in the encoding vector.

## 8 Coding Scheme

Default s(codingscheme) = C90THAI_ENCODING

## 9 Non-Thai Characters

Of the many different $\mathrm{LAT}_{\mathrm{E}} \mathrm{X}$ encodings, OT1 supports ASCII best (and this is what most Type 1 Thai fonts have). This has two advantages: We can use the raw Thai font without specifying a new encoding (switching to OT1 will be sufficient), and it will work with plain $\mathrm{T}_{\mathrm{E}} \mathrm{also}$.
We use the OT1 layout for typewriter fonts (i.e., for cmtt) with the exception that 'arrowup' and 'arrowdown' are replaced with 'endash' and 'emdash', and the seldom used 'dotlessj' with 'quotedblleft'.

Slot 0 'Gamma'
Unicode character U+0393, GREEK CAPITAL LETTER GAMMA.
Slot 1 'Delta'
Unicode character U+0394, GREEK CAPITAL LETTER DELTA.
Slot 2 'Theta'
Unicode character U+0398, GREEK CAPITAL LETTER THETA.
Slot 3 'Lambda'
Unicode character U+039B, GREEK CAPITAL LETTER LAMDA.
Slot 4 'Xi'
Unicode character U+039E, GREEK CAPITAL LETTER XI.
Slot $5{ }^{\prime} \mathrm{Pi}$ '
Unicode character U+03A0, GREEK CAPITAL LETTER PI.
Slot 6 'Sigma'
Unicode character U+03A3, GREEK CAPITAL LETTER SIGMA.
Slot 7 'Upsilon'
Unicode character U+03D2, GREEK UPSILON WITH HOOK SYMBOL.
Slot 8 'Phi'
Unicode character U+03A6, GREEK CAPITAL LETTER PHI.
Slot 9 'Psi'
Unicode character U+03A8, GREEK CAPITAL LETTER PSI.
Slot 10 'Omega'
Unicode character U+03A9, GREEK CAPITAL LETTER OMEGA.
Slot 11 'endash'
Unicode character U+2013, EN DASH.
Mandatory ligature endash $*$ hyphen $\rightarrow$ emdash
This is 'arrowup' in OT1 encoding.

## Slot 12 'emdash'

Unicode character U+2014, EM DASH.
This is 'arrowdown' in OT1 encoding.
Slot 13 'quotesingle'
Unicode character U+0027, Apostrophe.
Slot 14 'exclamdown'
Unicode character U+00A1, INVERTED EXCLAMATION MARK.
Slot 15 'questiondown'
Unicode character U+00BF, INVERTED QUESTION MARK.
Slot 16 'dotlessi'
Unicode character U+0131, LATIN SMALL LETTER DOTLESS I.
Slot 17 'quotedblleft'
Unicode character U+201C, LEFT DOUBLE QUOTATION MARK. This is 'dotlessj' in OT1 encoding.
Slot 18 'grave'
Unicode character U+0300, COMBINING GRAVE ACCENT.
Slot 19 'acute'
Unicode character U+0301, COMBINing acute accent.

## 10 Thai Characters

This is TIS-620 encoding with glyph variants. The encoding presented in [1] contained two alternate glyph forms at positions 157 and 158 which have been removed meanwhile.
The number of all Thai ligature rules is quite big (464 in total). Note that vptovf will make the ligature table much more compact as it may appear here.

Slot 128 'uniOE38'
