

The ifpdf package

Heiko Oberdiek
<heiko.oberdiek at gmail.com>

2010/01/28 v2.1

Abstract

This package looks for pdf \TeX in pdf mode and implements and sets the switch `\ifpdf`. The detection is based on `\pdfoutput` and the package will not change this value. It works with plain or \LaTeX formats.

1 Documentation

1.1 Introduction

It is commonly known that Hàn Thê Thành's pdfT_EX generates PDF output directly and many people uses pdfT_EX for this purpose. However the DVI output was never thrown away. In contrary, he new features for typesetting that works in both PDF and DVI mode.

In the meantime many T_EX distributions replace the traditional T_EX binary with pdfT_EX. Then, for example, called as latex pdfT_EX works in DVI mode with the L^AT_EX format preloaded, called as pdf_latex pdfT_EX starts in PDF mode.

Often packages or users want to know, whether the current document is typeset by pdfT_EX in PDF mode, because the different modes have different capabilities (color setting, graphics inclusion, ...). For this purpose pdfT_EX's `\pdfoutput` can be asked.

As regulary reader of T_EX newsgroups and mailing lists I could observe many problems with this task. Common errors are:

- pdfT_EX has *two* modes. Using pdfT_EX does not mean that the user always want to have PDF mode. For example, the PostScript support is better in DVI mode in conjunction with a PostScript aware DVI driver (e.g. dvips). Also the additional typesetting features are mode independent and also available in DVI mode.
- L^AT_EX's `\@ifundefined` inherited the side effect from `\csname`. Unknown commands are defined with the meaning of `\relax`. If it is checked, whether `\pdfoutput` is defined, then this should not be forgotten.
- Having `\pdfoutput` does not automatically mean PDF mode. Also the value of `\pdfoutput` must be asked.
- `\pdfoutput` must not be destroyed in some way. Later code and packages are fooled then and will perhaps make wrong decisions. For example they may drop support for PDF mode, because they do not know that pdfT_EX is running at all.

Robin Fairbairns provides an entry for this topic in his excellent FAQ (<http://www.tex.ac.uk/faq>): [Am I using PDFTeX?](http://www.tex.ac.uk/faq)

1.2 Usage

The package `ifpdf` can be used with both plain T_EX and L^AT_EX:

plain T_EX: `\input ifpdf.sty`

L^AT_EX 2_ε: `\usepackage{ifpdf}`

`\ifpdf` The package provides the switch `\ifpdf`:

```
\ifpdf
... do things, if pdfTEX is running in pdf mode ...
\else
... other TEX or pdfTEX in dvi mode ...
\fi
```

Users of the package `ifthen` can use the switch as boolean:

```
\boolean{pdf}
```

The package can also be used to set global documentclass options:

```

\RequirePackage{ifpdf}
\ifpdf
  \documentclass[pdftex,...]{...}
\else
  \documentclass[...]{...}
\fi

```

1.3 Specification

The package have the following properties:

- It asks the setting of `\pdfoutput` for detecting pdf \TeX in PDF mode.
- It never changes `\pdfoutput`.
- If `\pdfoutput` is undefined or has the meaning `\relax`, but the engine provides the primitive `\pdfoutput`, then `\pdfoutput` is enabled or restored if possible (only Lua \TeX , version 0.36.0 or higher).
- It can be used with many formats including plain \TeX and \LaTeX .

The mode detection implements the following algorithm:

```

if undefined(\pdfoutput)
  \ifpdf := \iffalse % pdf $\TeX$  is not running
else
  if \pdfoutput  $\leq$  0
    \ifpdf := \iffalse % pdf $\TeX$  in DVI mode
  else
    \ifpdf := \iftrue % pdf $\TeX$  in PDF mode
  fi
fi

```

The function `undefined` checks both cases, undefined command and `\relax`.

2 Implementation

```
1 (*package)
```

2.1 Reload check and package identification

Reload check, especially if the package is not used with \LaTeX .

```

2 \begingroup
3 \catcode44 12 % ,
4 \catcode45 12 % -
5 \catcode46 12 % .
6 \catcode58 12 % :

```

2.3 Check for previously defined \ifpdf

```

99 \begingroup
100 \expandafter\ifx\csname ifpdf\endcsname\relax
101 \else
102   \edef\i/{\expandafter\string\csname ifpdf\endcsname}%
103   \expandafter\ifx\csname PackageError\endcsname\relax
104     \def\x#1#2{%
105       \edef\z{#2}%
106       \expandafter\errhelp\expandafter{\z}%
107       \errmessage{Package ifpdf Error: #1}%
108     }%
109     \def\y{^^J}%
110     \newlinechar=10 %
111   \else
112     \def\x#1#2{%
113       \PackageError{ifpdf}{#1}{#2}%
114     }%
115     \def\y{\MessageBreak}%
116   \fi
117   \x{Name clash, \i/ is already defined}{%
118     Incompatible versions of \i/ can cause problems,\y
119     therefore package loading is aborted.%
120   }%
121 \endgroup
122 \ifpdf@AtEnd
123 \expandafter\endinput
124 \fi
125 \endgroup

```

2.4 \pdfoutput and LuaTeX

It might happen, that LuaTeX is running, but \pdfoutput does not exist. In version 0.40 only \directlua is available at startup time. The enabling Lua function was already added in version 0.36. Thus we can ignore older versions, here \pdfoutput is available at startup time.

```

126 \begingroup
127 \expandafter\ifx\csname pdfoutput\endcsname\relax
128 \else
129   \def\skip#1\relax\endgroup{\csname fi\endcsname\endgroup}%
130   \skip
131 \fi
132 \expandafter\ifx\csname directlua\endcsname\relax

```

```

133   \def\skip#1\endgroup{\csname fi\endcsname\endgroup}%
134   \skip
135   \fi
136   \expandafter\ifx\csname RequirePackage\endcsname\relax
137     \input ifluatex.sty\relax
138   \else
139     \RequirePackage{ifluatex}[2009/04/10]%
140   \fi
141   \ifluatex
142     \ifnum\luatexversion<36 %

```

Unhappily LuaTeX's `\primitive` (derived from pdfTeX's `\pdfprimitive`) cannot be used:

```
\protected\gdef\pdfoutput{\primitive\pdfoutput}
```

Setting a value works, but getting fails, because TeX does no longer see it as number. It is unexpandable and breaks numerical contexts.

```

143   \else
144     \directlua{tex.enableprimitives('ifpdf', {'pdfoutput'})}%
145     \global\let\pdfoutput\ifpdfpdfoutput
146   \fi
147   \fi
148   \relax
149 \endgroup

```

2.5 `\ifpdf`

`\ifpdf` Create and set the switch. `\newif` initializes the switch with `\iffalse`. `\newif` is `\outer` in plain TeX.

```

150 \begingroup\expandafter\expandafter\expandafter\endgroup
151 \expandafter\ifx\csname newif\endcsname\relax
152   \edef\pdffalse{%
153     \let
154     \expandafter\noexpand\csname ifpdf\endcsname
155     \expandafter\noexpand\csname iffalse\endcsname
156   }%
157   \edef\pdftrue{%
158     \let
159     \expandafter\noexpand\csname ifpdf\endcsname
160     \expandafter\noexpand\csname iftrue\endcsname
161   }%
162   \pdffalse
163 \else
164   \csname newif\expandafter\endcsname\csname ifpdf\endcsname
165 \fi

```

Test `\pdfoutput`. Is it defined and different from `\relax`? Someone could have used L^AT_EX internal `\@ifundefined`, or something else involving. Notice, `\csname` is executed inside a group for the test to cancel the side effect of `\csname`.

```

166 \begingroup\expandafter\expandafter\expandafter\endgroup
167 \expandafter\ifx\csname pdfoutput\endcsname\relax
168 \else
169   \ifnum\pdfoutput<1 %

```

`\pdfoutput=0` or negative, so not generating pdf.

```

170 \else
171   \pdftrue
172 \fi
173 \fi

```

2.6 Test for fool attempts

```
174 \begingroup
175 \expandafter\ifx\csname pdfoutput\endcsname\relax
176 \else
177 \escapechar=-1 %
178 \edef\m{\meaning\pdfoutput}%
179 \edef\p{%
180 \string p\string d\string f%
181 \string o\string u\string t\string p\string u\string t%
182 }%
183 \ifx\m\p
184 \else
185 \expandafter\ifx\csname PackageWarningNoLine\endcsname\relax
186 \def\PackageWarningNoLine#1#2{%
187 \immediate\write16{%
188 Package ‘#1’ Warning: #2.%
189 }%
190 }%
191 \fi
192 \PackageWarningNoLine{ifpdf}{%
193 Someone has redefined \string\pdfoutput%
194 }%
195 \fi
196 \fi
197 \endgroup
```

4 Installation

4.1 Download

Package. This package is available on CTAN¹:

[CTAN:macros/latex/contrib/oberdiek/ifpdf.dtx](#) The source file.

[CTAN:macros/latex/contrib/oberdiek/ifpdf.pdf](#) Documentation.

Bundle. All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](#)

TDS refers to the standard “A Directory Structure for T_EX Files” ([CTAN:tds/tds.pdf](#)). Directories with `texmf` in their name are usually organized this way.

4.2 Bundle installation

Unpacking. Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

Script installation. Check the directory `TDS:scripts/oberdiek/` for scripts that need further installation steps. Package `attachfile2` comes with the Perl script `pdfatfi.pl` that should be installed in such a way that it can be called as `pdfatfi`. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

4.3 Package installation

Unpacking. The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain T_EX:

```
tex ifpdf.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

```
ifpdf.sty          → tex/generic/oberdiek/ifpdf.sty
ifpdf.pdf          → doc/latex/oberdiek/ifpdf.pdf
test/ifpdf-test1.tex → doc/latex/oberdiek/test/ifpdf-test1.tex
ifpdf.dtx          → source/latex/oberdiek/ifpdf.dtx
```

If you have a `docstrip.cfg` that configures and enables `docstrip`’s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

4.4 Refresh file name databases

If your T_EX distribution (teT_EX, miK_TE_X, ...) relies on file name databases, you must refresh these. For example, teT_EX users run `texhash` or `mktextlsr`.

¹[ftp://ftp.ctan.org/tex-archive/](http://ftp.ctan.org/tex-archive/)

4.5 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the `.dtx` source file. It can be extracted by AcrobatReader 6 or higher. Another option is `pdftk`, e.g. unpack the file into the current directory:

```
pdftk ifpdf.pdf unpack_files output .
```

Unpacking with L^AT_EX. The `.dtx` chooses its action depending on the format:

plain T_EX: Run `docstrip` and extract the files.

L^AT_EX: Generate the documentation.

If you insist on using L^AT_EX for `docstrip` (really, `docstrip` does not need L^AT_EX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{ifpdf.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfL^AT_EX:

```
pdflatex ifpdf.dtx
makeindex -s gind.ist ifpdf.idx
pdflatex ifpdf.dtx
makeindex -s gind.ist ifpdf.idx
pdflatex ifpdf.dtx
```

5 History

[2001/06/14 v1.0]

- First public version.

[2001/07/14 v1.1]

- Documentation addition: global options

[2001/09/26 v1.2]

- Documentation typo corrected.
- Version number corrected.
- Line number in log entry removed.

[2005/07/22 v1.3]

- Some source code comments from Robin Fairbairns added.
- Bug fix for negative values of `\pdfoutput` (Oleg Katsitadze)
- LPPL 1.3
- Installation section with locations added.

[2006/02/20 v1.4]

- DTX framework.
- More robust check in case of undefined `\pdfoutput`.
- Extended documentation.

[2007/09/09 v1.5]

- Catcode settings added.

[2007/12/12 v1.6]

- Minor update.

[2008/12/12 v1.7]

- Fix in documentation for `\boolean` (found by S. Venkataraman).
- Code is not changed.

[2009/04/10 v2.0]

- Support for LuaTeX 0.40 added.
- Checks, whether `\pdfoutput` was changed.

[2010/01/28 v2.1]

- Compatibility to iniTeX added.
